Opening theory in go has a long history and has undergone many changes. In the 17th through 19th centuries, the first move in the corner was usually played on the 3-4 point, or occasionally the 5-3 or the 5-4 point. The star point was almost never played. Then in the mid-1930s, the "New Fuseki" became the vogue. The star point became a key feature and emphasis was placed on central influence. In present day opening theory, the star point still carries great weight, since it occupies the corner in one move, has a powerful influence along the sides, and permits a much faster development than the 3-4 point. Its weakness lies at the 3-3 point, from which the corner territory can easily be destroyed. However, more and more openings are being played today which emphasize tight territorial control. Here again the 3-3 point is critical, whether played to secure the corner territory with one move, or to destroy the opponents corner territory. In these openings many questions arise about Joseki in relation to the surrounding positions. In other words, Joseki cannot be confined to just one corner or just one side; the whole board must be taken into account. This book analyzes the role of the 3-3 point in opening strategy and features examples taken from about 100 of Chi Chikun's games. The opening is the most enjoyable part of the game to study. It is also the most intuitive part of the game, and its concepts are the easiest to grasp. Any reader who knows the rules should make effortless progress by reading this book.

Project practitioners and decision makers complain that both parametric and Monte Carlo methods fail to produce accurate project duration and cost contingencies in majority of cases. Apparently, the referred methods have unacceptably high systematic errors as they miss out critically important components of project risk exposure. In the case of complex projects overlooked are the components associated with structural and delivery complexity. Modern Risk Quantification in Complex Projects: Non-linear Monte Carlo and System Dynamics Methodologies zeroes in on most crucial but systematically overlooked characteristics of complex projects. Any mismatches between two fundamental interacting subsystems - a project structure subsystem and a project delivery subsystem - result in non-linear interactions of project risks. Three kinds of the interactions are distinguished - internal risk amplifications stemming from long-term ('chronic') project system issues, knock-on interactions, and risk compounding. Affinities of interacting risks compose dynamic risk patterns supported by a project system. A methodology to factor the patterns into Monte Carlo modelling referred to as non-linear Monte Carlo schedule and cost risk analysis (N-SCRA) is developed and demonstrated. It is capable to forecast project outcomes with high accuracy even in the case of most complex and difficult projects including notorious projects-outliers: it has a much lower systematic error. The power of project system dynamics is uncovered. It can be adopted as an accurate risk quantification methodology in complex projects. Results produced by the system dynamics and the non-linear Monte Carlo methodologies are well-aligned. All built Monte Carlo and system dynamics models are available on the book's companion website.

Since the beginning of the preparation of this volume, we have been convinced that temperature and pressure measurements should not be separated, particularly in different applications at low temperatures. This belief has made us deeply conscious of the fact that the advanced applications and modern experimental methods of investigation in science and technology need the combination of various professional experiences and approaches. Although the book is divided into two parts (Part I by F. Pavese and Part II by G. F. Molinar), we have tried to correlate low-temperature and low-pressure measurements as much as possible. We hope that our readers will find this book, which contains a large number of experimental and reference data, useful in their effort to solve measurement problems. We are pleased to acknowledge our debt to several persons and wish to express our gratitude to them for their valuable cooperation and help: to our research group colleagues at the Istituto di Metrologia "G. Colonnetti" -IMGC (CNR), without whom the knowledge and the experience we built up during many years could not have been acquired; to G. T. McConville, M. Dureux, and K. Grohmann for revisions of and various suggestions for Part I; to V. E. Bean and C. R. Tilford of NIST and G. T. McConville for revisions of and various suggestions for Part II; and to I. Prinetto of IMGC for many valuable suggestions and careful textual revisions.

An English translation of the classic Chinese go textbook, Sanzi Pu, written by go master Guo Bailing (c. 1587 - c. 1662). This book contains hundreds of diagrams from Guo's research on three-stone handicap games and 5 game records. It was customary to place the three stones at star points along the diagonal of the board, i.e. two diagonal hoshi plus tengen. Many of the variations contain dozens of moves (occasionally more than 100), as a result of quarter-board or even half-board fights. Particular emphasis is placed on the coordination of the tengen stone. Be prepared for a showcase of tesuji and semeai skills in these intense battles! In this book we describe the evolution of Classical Mechanics from Newton's laws via Lagrange's and Hamilton's theories with strong emphasis on integrability versus chaotic behavior. In the second edition of the book we have added historical remarks and references to historical sources important in the evolution of classical mechanics.

From a review of the first edition: "Modern Data Science with R... is rich with examples and is guided by a strong narrative voice. What's more, it presents an organizing framework that makes a convincing argument that data science is a course distinct from applied statistics" (The American Statistician). Modern Data Science with R is a comprehensive data science textbook for undergraduates that incorporates statistical and computational thinking to solve real-world data problems. Rather than focus exclusively on case studies or programming syntax, this book illustrates how statistical programming in the state-of-the-art R/RStudio computing environment can be leveraged to extract meaningful information from a variety of data in the service of addressing compelling questions. The second edition is updated to reflect the growing influence of the tidyverse set of packages. All code in the book has been revised and styled to be more readable and easier to understand. New functionality from packages like sf, purrr, tidymodels, and tidytex is now integrated into the text. All chapters have been revised, and several have been split, re-organized, or re-imagined to meet the shifting landscape of best practice.
