Online Library Advances In Biological Psychiatry

A method of behavioral control which utilizes nutritive sucking as the operant has been evolved in our laboratory. Using this technique we studied the role of arousal and learning in the development of environmental control over earliest feeding behavior. Few of the infants

Online Library Advances In Biological Psychiatry

in our studies were able to coordinate their sucking behavior to arbitrary operant-discrimination schedules, but when the individual pattern of sucking was taken into consideration, some infants rapidly adapted to the reinforcement schedule. Data from various

Online Library Advances In Biological Psychiatry

reinforcement schedules suggest that earliest mothering involves a mutual adaptation in which the nurturing environment approximates and then entrains the infant's feeding behavior by a perceptive manipulation of the infant's state of arousal. Coordination between the infant and its

Online Library Advances In Biological Psychiatry

environment sets the stage for associative learning, which develops following maturation of the infant's discriminative and response capacities. The process of behavioral acquisition begins with unconditioned feeding responses, which are transformed into complex

Online Library Advances In Biological Psychiatry

learned behavior through the mediation of an appropriately reinforcing environment. The infants studied showed individual differences in susceptibility to environmental control and in response to frustration. The relative importance of arousal and learning as determinants of

Online Library Advances In Biological Psychiatry

infant behavior are discussed and a hypothetical model for the earliest mother-infant relationship is proposed.

Qualitative evaluations of buccal smear specimens have indicated an unusually high incidence of triple-X

Online Library Advances In Biological Psychiatry

females in a hospitalized schizop
hrenic population. Specimens from
adult prisoners have also indicated an
unusually high incidence of triple-X
females. Studies of a population of
confined juvenile offenders, on the
other hand, have indicated an
unusually high incidence of one-X

Online Library Advances In Biological Psychiatry

females. No unusual indications were observed in a population of "normal" volunteer females. The data and their implications are discussed in context with previous observations.

ACKNOWLEDGMENTS This study was made possible primarily by research grants from the Scottish Rite

Online Library Advances In Biological Psychiatry

Committee on Research in
Schizophrenia, The National
Association for Mental Health, Inc.
Additional support was provided by a
grant from the National Institutes of
Health, GRS-05563. The study has
been supported by the State of Ohio,
Department of Mental Hygiene and

Online Library Advances In Biological Psychiatry

Correction, Division of Mental Hygiene. The author is particularly indebted to Edward N. Hinko, M.D., Regional Director of Research, whose advice and help made the present study possible. Invaluable cooperation and help have been received from the following
