### Anatomy and Root Canal Morphology

Dental anatomy is a field of anatomy dedicated to the study of human tooth structures. The development, appearance, and classification of teeth fall within its purview. Tooth formation begins before birth, and the teeth's eventual morphology is dictated during this time. Dental anatomy is also a taxonomical science: it is concerned with the naming of teeth and the structures of which they are made, this information serving a practical purpose in dental treatment. Usually, there are 20 primary te

The Central and lateral Incisors are the teeth designed to cut or shear our food while our cuspids also known as Canines are geared for grabbing and tearing food. The posterior teeth have a wider occlusal table and not as sharp cusps which are designed to crush and grind our food making food easier to digest.
