Industrial processes vary so the collector may be a hood, a flat-bed vacuum system or an on-tool dust collector. From here, the dust is extracted into the ductwork to industrial dust filters which filter the air, collect the dust and can then recycle clean air back into the workspace. One problem for the typical industrial dust control filter is that it can very quickly become clogged, reducing efficiency as airflow reduces.

Throughout the mining and processing of minerals, the mined ore undergoes a number of crushing, grinding, cleaning, drying, and product sizing operations as it is processed into a marketable commodity. These operations are highly mechanized, and both individually and collectively these processes can generate large amounts of dust. If control technologies are inadequate, hazardous levels of respirable dust may be liberated into the work environment, potentially exposing workers. Accordingly, federal regulations are in place to limit the respirable dust exposure of mine workers. Engineering controls are implemented in mining operations in an effort to reduce dust generation and limit worker exposure.
