The field of forensic psychology explores the intersection of psychology and the law. The purpose of this book is to examine topics in the field using the powerful, multidisciplinary, conceptually integrated approach that the natural sciences have embraced for decades with great success. Darwin's theory of evolution by natural selection is the meta-theoretical framework that unifies the field of biology. It unites research and understanding of the development, control, and organization of behavior. The study of humans, which includes all of the social sciences, is part of the field of biology. Darwin's theory provides a powerful meta-theoretical framework that can unify and energize forensic psychology, just as it has the biological sciences. Evolutionary processes

undoubtedly shaped physiological characteristics to help solve problems of survival and reproduction. The lungs, for example, with their vast surface area and moist membranes are marvelous adaptations for extracting oxygen and releasing carbon dioxide. Natural selection is the only known process capable of shaping complex functional mechanisms. Just as it shaped physiological adaptations with specific problem-solving functions, it also shaped our thoughts and emotions to guide behaviors toward solving recurrent problems of survival and reproduction. With this logic, we can use knowledge of ancestral problems to guide our understanding of how the mind works. Evolutionary Forensic Psychology is a necessary step toward a unified and complete understanding of psychology and the law. It recognizes that crimes such as murder, non-lethal violence, rape, and theft are manifestations of evolutionarily recurrent selection when they gave individuals an advantage in competition for resources. Each of the chapters that comprise this volume has been selected to provide the first unified examination of important research contributions and future directions of Evolutionary Forensic Psychology.

In our attempts to understand crime, researchers typically focus on proximate factors such as the psychology of offenders, their developmental history, and the social structure in which they are embedded. While these factors are important, they don't tell the whole story. Evolutionary Criminology: Towards a Comprehensive Explanation of Crime explores how evolutionary biology adds to our understanding of why crime is committed, by whom, and our response

to norm violations. This understanding is important both for a better understanding of what precipitates crime and to guide approaches for effectively managing criminal behavior. This book is divided into three parts. Part I reviews evolutionary biology concepts important for understanding human behavior, including crime. Part II focuses on theoretical approaches to explaining crime, including the evolution of cooperation, and the evolutionary history and function of violent crime, drug use, property offending, and white collar crime. The developmental origins of criminal behavior are described to account for the increase in offending during adolescence and early adulthood as well as to explain why some offenders are more likely to desist than others. Proximal causes of crime are examined, as well as cultural and structural processes influencing crime. Part III considers human motivation to punish norm violators and what this means for the development of a criminal justice system. This section also considers how an evolutionary approach contributes to our understanding of crime prevention and reduction. The section closes with an evolutionary approach to understanding offender rehabilitation and reintegration. Reviews how evolutionary findings improve our understanding of crime and punishment Examines motivations to offend, and to punish norm violators Articulates evolutionary explanations for adolescent crime increase Identifies how this knowledge can aid in crime prevention and reduction, and in offender rehabilitation

This book explores the evolutionary context of terrorism and political violence. While evolutionary

thinking has come to permeate both biological and social-science theorising, it has not yet been applied systematically to the areas of terrorism and political violence. This volume seeks to do this for the first time. It presents a collection of essays on evolutionary psychology and terrorism, which encourage the reader to approach terrorism from a non-traditional perspective, by developing new approaches to understanding it and those who commit such acts of violence. The book identifies evolutionary thought as heuristically important in the understanding of terrorism, explores the key conceptual themes, and provides an evolutionary (and cross-species) understanding of the community-wide effects of terrorist attacks. The contributors bring forward innovative ideas and concepts to assist the practitioner, analyst and academic to better understand and respond to the threat of terrorism. In doing so this book challenges existing assumptions about terrorism and those who carry out such acts, in order to move the debate into new areas characterized by an emphasis on intellectual quality and rigour, an interdisciplinary approach, and a drawing together of theory and practice. The intention is to provide a sufficient discussion to enable the reader to both understand the relevance of evolutionary thinking to terrorism and political violence, and to appreciate the practical implications of conceptualising problems in this way. This book will be of much interest to students of terrorism and political violence, psychology, criminology and security studies.

the pressures of natural selection. This is received wisdom in all scientifically informed circles. Currently, the topic of crime is rarely touched upon in textbooks on evolution and the topic of evolution rarely even mentioned in criminology textbooks. This book for the first time explores how an evolution informed criminology has clear implications for enhancing our understanding of the criminal law, crime and criminal behaviour. This book is directed more towards students of criminology than students of evolution. It is suggested that there is scope for more collaborative work, with criminologists and crime scientists exposed to Darwinian thought having much to gain. What is suggested is simply that such thinking provides a fresh perspective. If that perspective yields only a fraction of the understanding when applied to crime as it has elsewhere in science, the effort will have been worthwhile. The authors attempt to provide a modest appraisal of the potential contribution that a more welcoming approach to the evolutionary perspective would make to criminology; both theoretically (by expanding understanding of the complexity of the origins of behaviour labelled criminal) and practically (where the evolutionary approach can be utilised to inform crime control policy and practice). An evolutionary lens is applied to diverse criminological topics such as the origins of criminal law, female crime, violence, and environmental factors involved in crime causation.

Capturing a scientific change in thinking about personality and individual differences that has been building over the past 15 years, and this volume stands at an important moment in the development of psychology as a discipline. It draws together theoretical inspiration from life history theory, evolutionary genetics, molecular genetics, developmental psychology, personality psychology, and evolutionary psychology.

Evolutionary psychology is concerned with the adaptive problems early humans faced in ancestral human environments, the nature of the psychological mechanisms natural selection shaped to deal with those ancient problems, and the ability of the resulting evolved psychological mechanisms to deal with the problems people face in the modern world. Evolutionary psychology is currently advancing our understanding of altruism, moral behavior, family violence, sexual aggression, warfare, aesthetics, the nature of language, and gender differences in mate choice and perception. It is helping us understand the relationships between cognitive science, developmental psychology, behavior genetics,

personality, and social psychology. Foundations of Evolutionary Psychology provides an up-to-date review of the ideas, issues, and applications of contemporary evolutionary psychology. It is suitable for senior undergraduates, first year graduate students, or professionals who wish to become conversant with the major issues currently shaping the emergence of this dynamic new field. It will be interesting to psychologists, anthropologists, sociologists, economists, philosophers, cognitive scientists, and anyone interested in using new developments in the theory of evolution to gain new insights into human behavior.

Evolutionary approaches to the study of human beings have been able to explain the origin and maintenance of many of the features of our bodies. Many thinkers believe that an evolutionary approach will be equally fruitful when it comes to explaining the features of our minds. Since our behaviour is driven by our minds, our cognitive dispositions and processes are likely to have been a target of selection and adaptation. This volume collects recent prominent explorations of this theme, as well as the voices of dissenters who argue that our minds are far more significantly the product of culture than of evolution.

Evolutionary Psychology and Digital Games: Digital Hunter-Gatherers is the first edited volume that systematically applies evolutionary psychology to the study of the use and effects of digital games. The book is divided into four parts: Theories and Methods Emotion and Morality Social Interaction Learning and

Motivation These topics reflect the main areas of digital games research as well as some of the basic categories of psychological research. The book is meant as a resource for researchers and graduate students in psychology, anthropology, media studies and communication as well as video game designers who are interested in learning more about the evolutionary roots of player behaviors and experiences.

This book examines human psychology and behavior through the lens of modern evolutionary psychology. *Evolutionary Psychology: The New Science of the Mind, 5/e* provides students with the conceptual tools of evolutionary psychology, and applies them to empirical research on the human mind. Content topics are logically arrayed, starting with challenges of survival, mating, parenting, and kinship; and then progressing to challenges of group living, including cooperation, aggression, sexual conflict, and status, prestige, and social hierarchies. Students gain a deep understanding of applying evolutionary psychology to their own lives and all the people they interact with.
