The three Hansen Solubility Parameters of, for example, a solvent, a polymer, a nanoparticle or an excipient provide a simple but powerful way to better formulation. Explore the science of HSP and see how you can use them in your own application.

To overcome this limitation, Crowley et al. and later Hansen proposed to split this parameter into three components, $(\delta)^2 = \delta_d^2 + \delta_p^2 + \delta_h^2$, where δ_d is the dispersive component, δ_p is the polar component, and δ_h represents the hydrogen-bonding component of the solubility parameter. The dispersive interactions are related to the non-covalent London forces resulting from the instantaneous fluctuations of electrons.

as a way of predicting if one material will dissolve in another and form a solution. They are based on the idea that like dissolves like where one molecule is defined as being 'like' another if it bonds to itself in a similar way. Specifically, each molecule is given three Hansen parameters, each generally measured in MPa^{0.5}: δ_d $\{\displaystyle \ \delta_{d}\}$ The energy from dispersion forces between ...

For that solubility evaluation, FFE use Hansen Solubility Parameter (HSP). Other topics, Inorganics. Other topics about HSP. For inorganics, they will not dissolve to solvents but just disperse. Even though HSP can handle such phenomena. DIY (Do it Yourself) If you use HSPiP, you can do a lot of things. But if you use HSPiP with Y-MB, you can ...

If you raise the temperature then the density decreases so the HSP values go down. The effect depends on ΔT , the change of temperature from 25°C, and on the thermal expansion coefficient, α , which for simplicity in this app is set to 0.0007/K. The formulae (from Hansen and Beerbower, 1971) are: $\Delta D T = \Delta D^* (1 - \alpha \Delta T^* 1.25)$

This is true for absorption as well as for desorption (film drying). Appropriate solutions to the diffusion equation, Fick's second law, describe all of these. Evidence for this is found in the second edition of my CRC handbook Hansen Solubility Parameters: A User's Guide in Chapter 16 and earlier publications. The diffusion equation is a second order partial differential equation that requires two boundary conditions and an initial condition for solutions.
