derivative (PID) controller is a control loop feedback mechanism to ensure that the system is operating as intended. The PID is used to calculate the deviation to determine a correction factor and pass onto the process systems. PID controllers are used to remove the need for constant adjustments by the operator.

Unit 16: Instrumentation and Control Systems Unit Workbook 2

- Phone chargers have voltage and current control.
- Streetlights have light control.

These are small examples of control, but control can be developed into much larger systems. Heavy industry use control to monitor the condition of their equipment, we need to consider the pressure and the condition of pipework.

Instrumentation and Process Control is a comprehensive resource that provides a technician-level approach to instrumentation used in process control. With an emphasis on common industrial applications, this textbook covers the four fundamental instrumentation measurements of temperature, pressure, level, and flow, in addition to position, humidity, moisture, and typical liquid and gas measuring instruments.
