Electromagnetic radiation - Electromagnetic radiation - Microwaves: The microwave region extends from 1,000 to 300,000 MHz (or 30 cm to 1 mm wavelength). Although microwaves were first produced and studied in 1886 by Hertz, their practical application had to await the invention of suitable generators, such as the klystron and magnetron.

Microwaves are the waves that radiate electromagnetic energy with shorter wavelength. Microwaves are not reflected by ionosphere. Microwaves travel in a straight line and are reflected by the conducting surfaces. Microwaves are easily attenuated within shorter distances. Microwave currents can flow through a thin layer of a cable.

A Brief Introduction To Microwave Engineering and To EE 433 The microwave region is typically defined as those frequencies between 300 MHz and 300 GHz. (Recall 1 MHz = 1x106 Hz and 1 GHz = 1x109 Hz.) These frequencies include free-space wavelengths between 1 m and 1 mm. Here's a look at a few important regions in the electromagnetic spectrum...

Microwave is a form of electromagnetic radiation with wavelengths ranging from about one meter to one millimeter; with frequencies between 300 MHz (1 m) and 300 GHz (1 mm). [1] [2] [3] [4] [5] Different sources define different frequency ranges as microwaves; the above broad definition includes both UHF and EHF (millimeter wave) bands.

Domestic microwave ovens heat food with electromagnetic radiation at 2 450 MHz. The usual way to write large numbers in science is an integer, followed by a decimal point, followed by two decimal figures times a power of ten. So express 2 450 MHz in this scientific notation. Your answer will be in the unit of gigahertz.
