Wireline logging is performed by lowering a 'logging tool' - or a string of one or more instruments - on the end of a wireline into an oil well (or borehole) and recording petrophysical properties using a variety of sensors. Logging tools developed over the years measure the natural gamma ray, electrical, acoustic, stimulated radioactive responses, electromagnetic, nuclear magnetic resonance, pressure and other properties of the rocks and their contained fluids.

Well logging - Wikipedia

Wireline logging is a conventional form of logging that employs a measurement tool suspended on a cable or wire that suspends the tool and carries the data back to the surface. These logs are taken between drilling episodes and at the end of drilling. Recent developments also allow some measurements to be made during drilling.

Soon after each hole was logged, wireline log data were transmitted to LDEO-BRG for processing using a FFASTEST satellite high-speed data link. Data processing at LDEO-BRG includes (1) depth shifting all logs relative to a common datum (i.e., mbsf), (2) corrections specific to individual tools, and (3) quality control and rejection of unrealistic or spurious values.
