Annotation In 1996, Windows NT 4 introduced the typical administrator to point-to-point tunneling protocol (PPTP) and later added the Routing and Remote Access Server (RRAS) up20000517. Now, with the advent of VPN technology, Windows 2000 network administrators have the capability to roll out network designs that will save money, be faster and easier to administer and maintain, and will solve many connectivity problems that are impractical to solve before. One of the most important changes in Windows 2000 is the addition of enhanced routing (the first "R" in "RRAS") and better remote client services (the "RAS"). The key uses of these features are found in Microsoft's new virtual private networks (VPN) technology. The ever increasing number of mobile workers, as well as the demand for Internet access from every desktop has changed the face of the traditional network.
